Think outside the dot.
Welcome to a Revolution in Cell Analysis: Imaging Flow Cytometry

The ImageStream® system advances your science by combining quantitative cellular imagery with powerful population statistics.

With traditional cell analysis, you’ve had to choose between visualizing a few cells under a microscope without quantitation or analyzing large cell populations by flow cytometry without imagery. Microscopy gives you detailed fine structure, morphology, and qualitative molecular localization. Flow cytometry gives you robust statistical information and detection of rare sub-populations. No technology has been able to give you all this at the same time and in a single experiment.

Until now.

The ImageStream system from Amnis gives you morphology, fluorescence localization, and population statistics for a broad range of applications. Quantitate translocation of transcription factors between cellular compartments. Examine interactions in cell conjugates. Perform high throughput FISH. Examine cells in mitosis and apoptosis. Quantitate internalization. Study the distribution and abundance of fluorescent proteins.

And do it all in rare cells and highly heterogeneous samples.
An Entirely New Way to Analyze Cells

It’s all about the numbers: 500 quantitative parameters from six simultaneous images per cell; brightfield, darkfield and multiple fluorescence images; 0.75 NA optics; sub-micron resolution; over 15,000 cells per minute.

Advanced Detection Technology Delivers High Sensitivity With High Speed
A unique six-channel CCD camera and a novel velocity detection system work in concert to collect 1,000 times more light than conventional technology. The technique is called Time Delay Integration. The result is high resolution imagery with fluorescence sensitivity superior to flow cytometry.

Multispectral Imaging For Maximum Information Per Cell
Illumination in the ImageStream system is provided by a brightfield lamp, a 488 nm laser and optional violet and red excitation lasers. Cellular imagery is split into six component colors through a unique spectral decomposition element. The result is a brightfield image, a darkfield image, and multiple fluorescence images of every cell.

Simple Operation
ImageStream technology is sophisticated, but operating the instrument isn’t difficult. Highly automated protocols step you through calibration and set up. Focus and cell tracking are automatic. A single click of the mouse sterilizes the instrument. We’ve designed the ImageStream to allow you to concentrate on your research, not your instrumentation.
**Fluorescence Excitation**
A powerful solid state 488nm laser and optional red and violet lasers excite a wide range of dyes used commonly in microscopy and flow cytometry.

**Optical System**
A custom imaging objective with a numeric aperture of 0.75 and high performance optics achieve the image detail of a high quality microscope.

**Autofocus**
A sophisticated auto-focus system continually optimizes image quality.

**Velocity Detection**
A patented velocity detection system synchronizes the CCD camera readout with the motion of the cells.

**Spectral Decomposition Element**
A fan of dichroic mirrors splits the cell imagery into six spectral bands, one for each independent channel of the custom CCD camera.

**Time Delay Integration**
A custom six-channel CCD camera electronically tracks the motion of the cells, increasing the signal 1,000-fold. Fluorescence sensitivity exceeds standard flow cytometry.

**Cells in Flow**
Precisely-controlled fluidics position cells in the plane of focus as they flow through the system smoothly and without tumbling.

**Multispectral Imagery**
Six digital images per cell, including brightfield, darkfield, and multiple colors of fluorescence, convey tremendous quantitative information.
New Applications

**Cell Signaling / Pathway Analysis**
The ImageStream system brings significant new capabilities to pathway analysis for cells in suspension. The phosphorylation states of key signaling molecules and their locations within the cell can be measured directly. Molecular association with the cell membrane, the cytoplasm, or the nucleus is easily distinguished and quantitated.

**Analysis of Cell Conjugates**
Cells communicate through cell membrane-mediated molecular interactions. The ImageStream system not only identifies cell doublets, but also quantitates molecular co-localization at the interface between the interacting cells.

**Fluorescence In Situ Hybridization In Suspension (FISHIS®)**
High throughput FISH is now possible with cells in suspension using the ImageStream system and Amnis protocols. Imagery is acquired rapidly and extended depth of field technology provides exceptionally clear visualization of multicolor chromosome spots in a range of cell types.

**Internalization and Intracellular Trafficking**
Image similarity algorithms allow you to quantitatively compare the distribution of multiple signals within single cells for co-localization, co-capping, and similar studies.

**Gene Expression Analysis**
The ImageStream system is well suited to the analysis of Green Fluorescent Protein and other fluorescent markers used in the study of gene expression. The high spatial resolution and sensitivity of the ImageStream system allows quantitation of expression levels and localization of expression to specific regions of the cell and key organelles.
Receptor Mapping and Distribution
The ImageStream system not only measures the abundance of important cell surface receptors with exceptional sensitivity and resolution, but can also map their locations and co-localize them with ligands or intracellular organelles. For instance, proteins of interest may be co-localized with endosomal and lysosomal markers to follow intracellular processing and degradation.

Quantitative Morphology
Change in cell shape is closely correlated with function in the analysis of lymphocyte or macrophage activation, pseudopod formation, response to drugs, and many other instances. Powerful features in the IDEAS® image analysis software allow you to accurately classify cells based on shape and structure.

Cell Classification
Characterization of peripheral blood mononuclear cell populations is a fundamental tool in hematology. The ImageStream system combines classical surface phenotyping with morphologic classification to deliver a full five-part differential analysis with room for the identification of additional sub-populations using fluorescent markers.

Apoptosis
Using only measurements of nuclear morphology, the ImageStream system can directly differentiate apoptotic and necrotic cells, quantify the extent of apoptosis in cell populations, and calculate sub-population frequencies. The need for surrogate markers such as Annexin V or fluorescent caspase substrates is reduced or eliminated, as are classification errors found in conventional flow cytometric apoptosis assays, reducing false positive and false negative results.
Designed by Biologists for Biologists

Powerful, flexible, and extremely easy to learn, the IDEAS statistical image analysis package is integral to the ImageStream system.

A Robust Feature Set, Expandable to Meet Your Needs
The IDEAS feature set – the heart of the image analysis package – is extraordinarily robust, providing more than 500 features for every cell. IDEAS also allows you to create almost any new feature you find useful (e.g. nuclear to cytoplasmic area).

Image Data and Statistical Data are Fully Integrated
In IDEAS, graphs and imagery are completely integrated. Every dot on a scatter plot links directly to a cell’s images – click on the dot and you’ll see the corresponding cell. With its virtual sorting capability, IDEAS will show you all the images of a cell population you define.

An Efficient, Flexible Data Interface
The IDEAS interface integrates image data, plots, and statistics. The Gallery shows you images of every cell, while the Workspace gives you graphing tools to define and analyze cell populations. The Tabular Data section allows you to view population statistics as well as individual feature values.

Templates and Batch Processing
Once you’ve created an analysis scheme in IDEAS, you can save it as a template for batch processing future experiments or to share with your colleagues.
Data Linkage

Every dot in a scatter plot is linked to a set of cell images. Click on the dot to see the cell, or click on a cell's images to locate it in all plots.

Familiar Graphing Tools

Quickly and easily create scatter plots and histograms to define your cell populations. Display parameters are easily adjusted.

Rich Feature Set

IDEAS calculates over 80 features for each image and over 500 features per cell, allowing the discrimination of subtle differences between cell populations.

Simple, Flexible Population Definitions

Easy to use gating tools allow you to define, name and visualize cell populations quickly and intuitively.

Quantitative Data Plotting

Any image analysis feature can be used in a histogram or dot plot. Extend your analysis beyond simple fluorescence intensity with localization and morphology features.
**Advanced Performance**

---

**EDF™ technology breaks the classical depth of field barrier**

**Image the Whole Cell in Focus**
EDF extended depth of field technology uses a combination of specialized optics and unique image processing algorithms to project all structures within the cell into one crisp plane of focus.

**Enables New Applications**
Many applications, such as FISH, depend critically on the resolution and accurate counting of spots within the cell. With the exceptional focus depth of EDF, high throughput analysis of FISH has become a reality.

**Improved Precision and Discrimination**
In addition to increasing depth of field, EDF improves resolution, thereby enhancing the discrimination of cellular features and improving precision in the quantitative analysis of cell imagery over a wide array of applications.

**Reduced Data Acquisition Time**
In addition to keeping the whole cell in focus, the EDF option allows the ImageStream to be run with a larger core diameter, thereby increasing throughput by up to three-fold.

**The EDF Extended Depth of Field Option**
The EDF option for the ImageStream system includes all required modifications to the instrument and software, installation, testing, documentation and user training. The EDF option can be included with a new ImageStream system or installed as a field upgrade.
ImageStream Specifications

Advanced Engineering Creates Exceptional Performance

**Performance**
- Imaging rate: up to 300 cells/second
- Sample throughput: ~5 min/sample
- Detection limit: <50 fluorescent molecules
- Numeric aperture: 0.75
- Pixel size: 0.5 x 0.5 microns
- Field of view: 45 microns wide
- Sample volume: 40-200 microliters

**Data Analysis**
- Automated crosstalk compensation post-acquisition
- Unlimited user-defined image features
- Over 500 standard image features per cell

**Instrument Operation**
- Automated sample load, empty, flush, and purge
- Automated focus and core position tracking
- Automated sterilization
- Automated calibration and quality control
- Automated laser alignment

**Requirements**
- 90-240 VAC, 50-60 Hz
- 100 Mbps ethernet, minimum
- No external air or water required
- 36"w x 24"h x 24"d
- 350 lbs

The ImageStream system includes a solid-state 488 nm laser (200 mW) as the standard excitation source. The laser options include a red 658 nm laser (80 mW) and a high power violet 405 nm laser (350 mW). Each of these laser options is available factory installed or they may be purchased for installation on an existing ImageStream system.

The dyes listed here represent just some of those that may be used on the ImageStream system configured with 405 nm, 488 nm and 658 nm lasers. The ImageStream is a Class 1 laser product.
